Within the last 10 years the Inuit of Nunavut, Canada, have been witness to drastic temperature changes, the disappearance of their food sources, the dangers of rising temperatures and the impact the melting ice has on their environment.

This presentation will explore the following questions:

- What is causing the ice to melt at a rate of two to fourteen degrees more than other frozen Continents?
- What can be done to ensure the Inuit are able to adapt to the changing food sources and land?
- How soon before the opening of the Northwest Passage will pollution cause more problems?
